Load Packages	1
Data Pre-processing	1
Conjoint Analysis	3

Load Packages

```
if (!require(tidyverse)) {  
  install.packages("tidyverse")  
  library(tidyverse)  
}  
if (!require(cjoint)) {  
  install.packages("cjoint")  
  library(cjoint)  
}
```

Data Pre-processing

Read the data.

```
conjoint_RAW <- read_csv("jjps_si_japan_brazzill-magara-yanai.csv")
```

Transform conjoint attributes into factors:

```
conjoint <- conjoint_RAW %>%  
  mutate(inctax = factor(inctax),  
         govedu = factor(govedu),  
         govfem = factor(govfem),  
         govsssec = factor(govsssec),  
         salestax = factor(salestax),  
         corptax = factor(corptax),  
         govccare = factor(govccare),  
         govdebt = factor(govdebt))
```

Transform explanatory variables of interest into factors:

```
conjoint <- conjoint %>%  
  mutate(  
    # Gender  
    gender = factor(gender, levels = c("female", "male")),
```

```

# Social Values
socialv2 = ifelse(socialv %in% c(1:2), 1, NA),
socialv2 = ifelse(socialv %in% c(3:4), 2, socialv2),
socialv2 = factor(socialv2,
                  levels = 1:2,
                  labels = c("libertarian", "authoritarian")),

# Economic Values
econv2 = ifelse(economicv %in% c(1:2), 1, NA),
econv2 = ifelse(economicv %in% c(3:4), 2, econv2),
econv2 = factor(econv2, levels = 1:2,
                labels = c("redistributive", "free-market")),

                                             "bachelor+"))
```

Create a data set including only respondents who answered the conjoint experiment.

```
conjoint_comp <- filter(conjoint, !is.na(selected))
conjoint2 <- conjoint_comp %>%
  rename(`IncomeTax` = inctax,
         `Education` = govedu,
         `WomenEmployment` = govfem,
         `SocialSecurity` = govsssec,
         `SalesTax` = salestax,
         `CorporateTax` = corptax,
         `Childcare` = govccare,
         `GovtDebt` = govdebt)
```

Prepare the Conjoint Analysis

Conjoint attributes

```
conjoint_attr <- c("IncomeTax", "Education", "WomenEmployment", "SocialSecurity",
                  "SalesTax", "CorporateTax", "Childcare", "GovtDebt")
```

Create the design object

```
attr_list2 <- list()
for (A in conjoint_attr) {
  attr_list2[[A]] <- unique(pull(conjoint2, A))
}
si_design2 <- makeDesign(type = "constraints", attribute.levels = attr_list2)
```

Set the baseline values for the attributes.

```
base_list2 <- list()
for (A in conjoint_attr[1:7]) {
  base_list2[[A]] <- "sq"
}
base_list2[["GovtDebt"]] <- "noIncrease"
```

Conjoint Analysis

The Base Model

```

Subsetting based on Social Security Spending

Create a new baselines list excluding SocialSecurity

```
base_list_ssec <- list()
for (A in conjoint_attr[1:3]) {
  base_list_ssec[[A]] <- "sq"
}
for (A in conjoint_attr[5:7]) {
  base_list_ssec[[A]] <- "sq"
}
base_list_ssec[["GovtDebt"]] <- "noIncrease"
```

Subset the data so only candidates who will decrease social security are selected

```
conjoint_ss_dec <- conjoint2 %>%
  filter(SocialSecurity == "decrease")
```

Run the conjoint analysis

```
cj_ss_dec <- amce(selected ~ Education + WomenEmployment + Childcare +
  IncomeTax + SalesTax + CorporateTax + GovtDebt,
  data = conjoint_ss_dec,
  design = si_design2,
  respondent.id = "ID",
  baselines = base_list_ssec)
```

Subset the data so only candidates who will maintain the current level of social security are selected

```
conjoint_ss_sq <- conjoint2 %>%
  filter(SocialSecurity == "sq")
```

Run the conjoint analysis

```
cj_ss_sq <- amce(selected ~ Education + WomenEmployment + Childcare +
  IncomeTax + SalesTax + CorporateTax + GovtDebt,
  data = conjoint_ss_sq,
  design = si_design2,
  respondent.id = "ID",
  baselines = base_list_ssec)
```

Subset the data so only candidates who will increase social security are selected

```
conjoint_ss_inc <- conjoint2 %>%
  filter(SocialSecurity == "increase")
```

Run the conjoint analysis

```
cj_ss_inc <- amce(selected ~ Education + WomenEmployment + Childcare +
